

Less Interactive, Instruction-Driven Package Installer Scripts

Directory:

```
root of the repository folder
```

Files:

```
02_debian_minimal_packages.sh
```

Usage:

Allow the file to execute (change permission parameters) (*common step*):

```
chmod +x 02_debian_minimal_packages.sh
```

2. Run:

```
./02_debian_minimal_packages.sh
```

Imp: Do not prepend `sudo` .

NOTE:

The files in the root of this folder are collections of instructions that can be used to configure a freshly installed Debian Linux system. The process is mostly instruction-driven, less interactive and less dependent on the user inputs. Do not blindly run the scripts since you may not need all the packages. The script can be a good starting point to come to a perfect script of your own. I strongly encourage you to make that changes to tailor your needs, which will save time in the long run.
